American Fiber Cement Corporation Introduces New Facade Panel with Dimensional Effect

American Fiber Cement Corporation introduces Patina Inline, a brand-new facade panel with a dimensional effect. This panel meets the rising demand of architects and builders around the world who want to add character and depth to a building.

Facades with character and depth are gaining ground in the construction industry. Today, architects and builders around the world are asking for building materials that offer more design options in terms of angles, patterns and colors. To meet the increasing demand, Cembrit, partner and manufacturer of American Fiber Cement Corporation, has created this brand-new design.

Robust Materials and Maintenance-Free

- High Strength and Durability
- Maintenance-Free
- Resistant to Rough Weather Conditions and Wear for Decades

Patina Inline is part of the Patina Design Line – a collection of facade panels that share the same authentic expression. In addition to Patina Inline, this authentic design line also includes Patina and Patina Rough. Patina Inline is available in three colors: graphite, flint, and sand. The board is through-colored, ensuring a homogeneous color when cut to size.

For more inspiration, visit [American Fiber Cement Corporation's website](#) and watch your ideas come to life with the [Cembrit Visualizer](#). This tool allows users to visualize how Patina panels look when applied to different building types.

About Cembrit Patina Inline

- Available in graphite, flint, and sand: P 050, P 070 and P 545
- Two standard sizes (48 x 96 in (1220 x 2440 mm) and 48 x 120 in (1220 x 3050 mm))
- Facade design with authentic and continuous lines
- Vibrant facade with dimensional effect
